Setting up a new smart TV has never been more difficult. Every day, smart TVs get smarter - which means there's more for us to figure out. How can you coordinate your set of top box, game console, and various other devices, and why do they want all this personal information just to run the TV? Don't worry, we're here to help, with step-by-step instructions for tweaking your LG TV. From connecting lg remote control to connecting Wi-Fi on an LG TV, we'll go through the process to get your LG smart TV up and running. LG is currently on version 5.0 of its own webOS smart TV software (compared to models that use Google Android TV or Roku software). This makes it unique, and the company uses an unusual remote control that can behave like a bat, directing the cursor on the screen. Here's how to start setting it up for the first time: (Image credit: Tom's Guide)1. Find the OK button. Next to the remote control center is a four-way directional panel with a clicked thumb wheel in the center. This is the main way to flick through the menu and control things on the screen. The first thing to do when the TV is on is to press the OK button on the screen, depressing the click wheel (you'll hear a voice request to do so as well). This automatically connects the remote control to the TV. (Image credit: Tom's Guide) 2. Where in the world? Then you have to tell the TV where you are, what language you want to use, and the time zone you are in. It needs this data to create automatic program guides later. Don't choose to use this TV as a store mode. This setting oversaturates colors and pushes brightness levels over the top, distorting the picture (but making it more attractive in stores). You will also be asked here if you want to keep the robotic sound cue guide enabled (most people turn them off). (Image credit: Tom's Guide) 3. Connecting devices. You will then be asked to connect the devices. If you connect and turn on devices such as a Roku box, Apple TV or game console such as PlayStation 4, the TV will automatically recognize the relevant input later in the settings process. (Image credit: Tom's Guide) 4. Internet access. This is one of the most important parameters that makes an Internet connection. LG TV will use this connection to update software, add apps and connect to streaming services such as Netflix and YouTube. Fortunately, you don't need to know much to connect Wi-Fi on an LG TV. You will be presented with a list of available networks that he sees. Simply select your preferred Wi-Fi network from the list and enter your password when it's If you've secured your network without broadcasting it to SSID, there's a hidden version of the network at the end of the list of available networks. Choose this option to manually enter your Wi-Fi network name and then your password. (Note: Most LG kits also have an Ethernet port in case you want to make a wired connection.) Privacy choices. The inevitable terms of the agreement appear as soon as you you to your Wi-Fi network. You can simply agree to all of them or only the first two for basic services. Some owners may find some of the agreements quite invasive, such as gathering information about all the programs and channels you and your family watch, how long you watched them, and what devices you used. LG uses this information to give advice on what to watch, among other things, but even if you don't choose, some of your browsing information will still be collected. There are similar choices for the use of voice recognition information, which is shared with Nuance's voice reco, ostensibly to improve the accuracy of voice recognition software. You should note that some features won't work if you agree to specific terms, but LG you'll give the opportunity to change your choices later as well. (Image credit: Tom's Guide) 6. TV source. LG software will finally scan all the connections of the set to see that you are connected to it. (If you didn't follow the instructions on step 3, don't worry. It must recognize the most common sources and it will ask you about how you watch TV (antenna, cable, satellite, etc.). On the next screen, enter your zip code, which will be used to create a local electronic guide to the program and set your time zone. (Image credit: Tom's Guide) 7. AI functions. You'll see an extra screen to customize the functions of artificial intelligence. There are AI Picture Pro and AI Sound Pro; First recognize objects, such as faces and text, to automatically sharpen some elements of the image. later sound settings to give it more presence or a brighter sound that appears to come from the obvious center of the screen. (Image credit: Tom's Guide) 8. Channel scanning. Depending on the source you use for the TV, the set will scan for all available channels. Choice Start initiates scanning. (Note: If you seem to lose some broadcast channels later using the antenna, do rescan. The FCC is traveling stations around to different parts of the transmission spectrum.) (Image credit: Tom's Guide) 9. Made. It's done. The final screen splash tells you you're finished. If you choose Made, you'll go live to television sources, whether it's an antenna, cable or your preferred streaming app. If you choose LG Channels, which is a collection of free streaming channels on the Internet, you will be asked to agree to the lg Channels User Agreement (if you haven't already). Just scroll down the list to see it highlighted. This LG should be environmentally friendly - it got a globe on it for most manufacturers Enlisting an eco-conscience is a big thing at the moment, as the government and consumers alike have begun to worry that our insatiable appetite for technology is damaging the environment. Enter FLATRON W2252TE. Despite being a name that can easily make it a robot in the Transformers franchise, FLATRON is LG LG's eco-friendly display reportedly 45 percent less energy hungry than the average computer screen. The feature of focusKako energy consumption has been reduced, the function is not. The contrast factor remains at an impressive 10,000:1 - when in movie mode - while the monitor also houses the cheetah as 2ms response time. The resolution is high, starting with 1440x900 in zoom mode and 1680x1050 at all other times. Speaking about the new eco monitor, Fiona Landsberg, marketing manager, LG Electronics, said: With the ever-increasing time consumers spend on computers these days, there is a need for products that are more energy efficient. W2252TE gives consumers the opportunity to work, play games, watch movies or travel online, safely knowing that they are doing as much as possible to help reduce their impact on the environment. We are committed to expanding our green portfolio of monitors with products that are either equal or better than the energy savings provided by W2252TE. This 22nd monitor will be available from Aug. Prices must be confirmed. Tara Dooley Donation to Charities is usually a win-win situation. Charity receives much-needed materials, money or work; you get a warm feeling inside and a tax charge. That being said, it is not always easy to donate large items such as furniture, big screen TVs or cars. You couldn't donate to the charity you want because not all places have a room or the ability to handle this kind of thing. Take your TV to a charity retailer such as Goodwill, Salvation Army or Habitat for Humanity. These stores are created to sell donated goods and use the money to run the organization and help others. It is best to call ahead to make sure the location takes up large items. They can have a separate drop-off seat for more expensive items such as large-screen TVs, cars or furniture. Donate a TV to an organization that can use it, such as a church. Many churches use large-screen TVs in classrooms to help with sermons or make sure everyone can see what's going on. They can also use it in a recreational room designed for youth congregations or sell it at a fundraising auction or backyard sale. Call a charity that comes to the districts and picks up big items. The Kidney Foundation is one such charity. Another goodwill. Place an item on the side of the road in front of your house with a clearly marked tag with the name of the charity. Take a big-screen TV to an organization such as a women's shelter where they are under violence. They could use it in an institution to keep protected women and children entertained or give it to a woman, creates a new home. Sometimes you need multitasking on your Android phone. Especially if you're trying to refer to a text message for the code, or pull up that email password to log into the app on your device. So how do you activate a split screen on Android? Keep reading to learn how to activate the split screen and how to disable it. The instructions in this are this Apply to stock Android phones such as Google Pixel, and Samsung Android phones from Android version 7.0 and above. It's easy to activate the split-screen option on modern versions of Android stock phones. On older versions of Android (pre-7.0) there were many additional steps to achieve this. However, on later versions of Android, this is a simple task that works with most third-party applications and requires minimal steps to achieve the goal of multitasking as a professional. The split-screen feature has been around for some time, although it has been known as a multi-window in other Android flavors. Go to the Apps menu and select any app of your choice. For this case, we chose settings. Then press and hold the central navigation button at the bottom of the device as you swipe up. Some devices may have a physical button however on new devices it is a digital button. When whisked up, the window settings will emphasize. Choose your settings. The app or split-screen information settings are displayed. Select split screen. Your first app will appear at the top of the screen. At the bottom of the screen, chose the second app that you would like to use in split-screen mode. The second window opens, so you see two windows side by side or from top to bottom on the display. Now you can move freely and multitasking between two windows. When you do multitasking with a split screen or multi-window it's quick and easy to return the device to one screen again. In the split screen window, tap and hold the middle black strip separating the two screens and swipe in the direction of the screen that you no longer want to use. This will close this app, allowing you to continue using another program as your primary app. The production results on the Samsung device are very similar to the stock versions in that you also have to follow about the same steps. If you want to use the multi Window split screen in landscape mode, make sure the automatic rotation is on and simply turn the phone horizontally while in a split view of the screen. First, you want to access your now open apps by clicking the latest button to the left of the Home button. In newly used apps, tap the app icon for the first app you want to use in Split-Screen mode. It's located at the top, middle of the app map, which is displayed in your newly used apps. From the menu that appears, select Open in the split-screen view if it's available for that app. Not all apps are available for split-screen mode. If you hit the app icon and the ability to open in a split view of the screen does not appear, the split-screen option is not available, and you will have to use the app in full screen mode. Then The second app you want to open in the latest options, or you can choose another app from the list of apps. If it worked successfully, the second app should appear directly under the first app opened and have equal intervals on the screen. When you've finished using the separation division Option on Samsung Android, it's quick and easy to return the device to one screen again. In the split screen window, tap and hold the middle dividing strip and drag it in the direction of the screen that you no longer want to use. This closes this app allowing you to continue to use others in Full Screen mode. There aren't many difficulties with multitasking, and it can be a simple process to reach a split screen on Android as long as the apps you're trying to use allow it. Some programs won't work in sharing the view of the screen. For example, games usually require a full screen viewer and full device resources to work properly. Apps that don't allow you to split the screen are displayed on a case-by-case basis. Many applications that come complete with the device, or for performance and business purposes must work using the above steps.
